- Tested for : M/S Senses Akustik,
Plot # 102, New GIDC,
Gundlav,
Valsad (Gujarat) - 396035
Customer Ref. No.: NIL
Dated 14/03/2022
- Description and Identification of Items : Echo Brick – Felt, Polyester Foam
(Sample size: 610mm x 1219mm x 20mm) x 12 pieces
- Environmental Conditions : Room Temperature: 23.0 ± 5.0 °C
Relative Humidity: 50.0 ± 20.0 %RH
- Standards used and Associated Uncertainty : Dual channel Acoustic Analyzer with
Working Standard Microphone
: ± 0.4 dB to 0.6 dB
- Traceability of Standard Used : The standards used for testing are traceable to
National Standards which realize the units of quantities
according to the International System of Units (SI).
- Principle/Methodology of Testing and Test Procedure No. : Sound absorbing coefficient by diffuse field
method: IS: 8225-1987 "Measurement of Sound
Absorption Coefficient in Reverberation Room"
(Equivalent to ISO: 354-2003,
ASTM C-423 09a and ASTM 423-90)
Sub-Div # 1.07/Doc. 3/ TP # 01
- Results:
As requested by the party, the material was tested only for its sound absorption coefficient by reverberation method as per IS:8225 – 1987 under existing environmental conditions in a reverberation chamber of volume 271 m^3 , surface area 240 m^2 and average reverberation time of 6 sec. The chamber was of irregular shape and adequate diffusion was obtained by using suspended stationary diffusers.

Sound Absorbing Material

दिनांक/Date	रिपोर्ट संख्या/Report No.	पृष्ठ /Page	पृष्ठों की संख्या /No. of Pages

A loudspeaker with uniform spherical radiation was used as the source of sound suspended at a height of 2.5 m above the floor in one corner while the microphone was kept in different locations near the other corners of the room and at least 1 m away from any surface. The material was kept on **Rigid backing** so as to get an exposed sample area of 12.0 m².

Measurements were made by using 1/3-octave bands of random noise and several decay rates were determined for each of the microphone and loudspeaker positions. The sound absorption coefficient was calculated and the correction for boundary absorption was applied. The results were:

Frequency (Hz)	Sound Absorption Coefficient (α)	NRC
125	0.02	0.47
250	0.07	
500	0.30	
1000	0.64	
2000	0.85	
4000	1.00	

The evaluated uncertainty in measurement is $\pm 5\%$ which is at a coverage factor $k = 2$ and which corresponds to a coverage probability of approximately 95% for normal distribution.
